## Internal Quantum Signal Enhancer - iQSE

**BUY NOW**

The iQSE is a passive device that is activated by electromagnetic energy and is ideal inside of components where the electromagnetic energy is at the highest concentration. No soldering is required, and the units can withstand high heat situations. Placement can be done simply by using the attached magnet or included double stick tape. Placement can be on any wall at the inside of the component chassis. This product works similar to the popular QSE, but it's small footprint and design makes it ideal for internal placement. Once installed the iQSE creates an electric and magnetic field that in turn effects the surrounding electrons, rendering them more streamline and efficient. The results are a stunning improvement in overall musicality.
